

Mehmet Başaran

DevOps Engineer | Linux System Administrator | Monitoring & Observability

Ankara, Turkey | +90 531 380 3779 | mehmet94nto@gmail.com | <https://nto4.github.io/mehmet.basaran.github.io/>

Professional Summary

DevOps Engineer and Linux System Administrator with 5+ years of production DevOps and operations experience and 8 years of hands-on Linux experience. Experienced in Ubuntu, Red Hat, and Debian-based environments supporting Java and .NET Core application stacks, PostgreSQL-focused data layers, and high-availability services such as Elasticsearch, Cassandra, and Kafka. At Sebit, progressed from Monitoring Specialist to DevOps Engineer while supporting 1000+ VMs, 10+ vanilla Kubernetes clusters, and 200+ microservices. Built monitoring platforms from scratch and designed automated CI/CD deployment workflows for monolithic applications and microservices. Supported production systems serving up to 2 million active users, including a COVID-19 period with 20x user growth.

Core Skills

Platforms & Environments: Ubuntu, Red Hat, Debian, VMware, Docker

Containers & Orchestration: Vanilla Kubernetes (10+ clusters), Helm, 200+ microservices, rollouts, rollbacks, service troubleshooting

CI/CD & Automation: Jenkins, GitLab Runner, GitLab CI/CD, reusable ci.yml templates, Ansible, Bash, Python

Monitoring & Observability: Prometheus, Grafana, Alertmanager, Nagios, Zabbix, auto-discovery, Glowroot, Elastic APM, trace analysis

Databases, Search & Messaging: PostgreSQL (primary), MySQL, Elasticsearch, Cassandra, Kafka, Memcached, McRouter

Runtime, Middleware & Web: Java runtime, .NET Core runtime, Nginx, Tomcat

Cloud: AWS EC2, RDS, Load Balancer, S3, Lambda

Version Control: Git

Additional: 1000+ VM environments, high availability, capacity planning, incident response, release management, production support

Professional Experience

Sebit Information & Education Technologies Inc. | Ankara, Turkey

DevOps Engineer | Sep 2022 - Present

- Design, build, and maintain fully automated CI/CD workflows with Jenkins, GitLab Runner, GitLab CI/CD, Ansible, and Docker for monolithic applications and microservices deployed to vanilla Kubernetes.
- Standardize reusable reference ci.yml templates so new projects can link to the pipeline, update values, and deploy through developer self-service or DevOps-managed workflows.
- Automate deployment flows where a developer code push triggers build, container image creation, static code analysis, beta deployment, and controlled promotion to pre-production and production with QA/developer approval gates.
- Deploy and operate 200+ microservices across 10+ vanilla Kubernetes clusters with Helm, including chart configuration, values management, rollout/rollback coordination, and service-level troubleshooting.
- Supported production platforms serving up to 2 million active users during the COVID-19 period, when user volume grew 20x, contributing to reliability, capacity planning, resource scaling, and release readiness.
- Operate and support 1000+ Ubuntu, Red Hat, and Debian VM environments and related services manually and through automation with Ansible, Bash, and Python.
- Install, configure, and administer high-availability production services under load, including PostgreSQL, Elasticsearch, Cassandra, Kafka, Nginx, Tomcat, and Kubernetes-based services.
- Operate Java and .NET Core runtime stacks in Linux-based environments, with PostgreSQL used as the primary relational database for many production workloads.
- Manage beta, pre-production, and production deployments; support release processes; and resolve deployment issues with development teams.
- Investigate incidents and runtime performance issues using Prometheus, Grafana, Glowroot, Elastic APM, logs, service metrics, and alert signals.

Monitoring Specialist | Sep 2020 - Sep 2022

- Designed and implemented monitoring infrastructure from scratch for monolithic applications, VM-based systems, and core services using Nagios and Zabbix.
- Automated VM and service discovery, group assignment, and activation of relevant monitoring checks for newly detected infrastructure and application services.
- Monitored infrastructure health across CPU, disk, memory, mounts, services, port listening checks, and application-specific service availability.
- Created custom monitoring scripts and plugins for service availability, infrastructure metrics, and application health checks.
- Expanded observability for microservices and Kubernetes environments with Prometheus, Grafana, and Alertmanager.
- Implemented runtime and application performance visibility with Glowroot and Elastic APM, including response times, error rates, and error trace analysis.
- Analyzed alerts, coordinated incident triage, and helped improve service visibility across virtual machines, Kubernetes, and application services.

Sole Proprietorship | Remote / Turkey

DevOps Consultant & System Monitoring Specialist | Jun 2024 - Present

- Provide DevOps, monitoring, and infrastructure support for client systems, including HA service setup, deployment automation, and observability improvements.
- Deploy and maintain CI/CD pipelines with GitLab, Jenkins, Ansible, Docker, Kubernetes, and Helm for application delivery workflows.
- Support AWS service setup and management, including EC2, RDS, Load Balancer, S3, and Lambda.
- Troubleshoot Kubernetes, Linux, service, and deployment issues; create automation scripts to reduce repetitive operational work.

Education

B.E., Computer Engineering | Gazi University, Faculty of Engineering | GPA: 2.62/4.00 | 2021
